

The Flexible boat trailer for larger boatclubs and marinas.

The Sublift 40 is a suitable machine for the marina with a mix of boats in different sizes.

The design with six arms makes it possible to lift larger vessels with higher precision. Still you can easily handle midsize vessels by only using the middle and front pair of arms or even smaller vessels by using the middle and back pair.

The six lifting cylinders, which operate in pairs, allow the boat to be held horizontally throughout the handling operation, irrespective of the angle of the ground.

The Sublift is completely submerged below the water surface when landing and launching a boat.
